## DETAILED ACTION

### *Election/Restrictions*

Claims 17-22 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected Group II, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 8/6/08.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-4, 7-8 and 10 are rejected under 35 U.S.C. 102(e) as being anticipated by Taylor et al. (USPN 6,670,608).

Taylor teaches a gas sampling method for a mass spectrometer that comprises evacuating low temperature zone (not heated by heater 44, so inherently lower than the zone in which heater 44 heats) of a sampling system using a vacuum pump (mass spectrometer operating 10 to the minus 6 torr, fig. 3) (col. 3, lines 5-10), admitting a portion of a high temperature (heater 44 heats portion of capillary 32) process stream into the mass spectrometer through an orifice (the point in which the capillary 32 passes

through wall of the vacuum chamber), maintaining a stable vacuum pressure in the mass spectrometer (inherent for proper functioning of mass spectrometer), introducing a sample from the low temperature zone of the sampling system into a mass spectrometer through a sample introduction valve (the actual introduction through the valve of the mass spectrometer), maintaining a temperature of the low temperature zone above a boiling point of the target sample component at the stable vacuum pressure. It is inherent that the sample is maintained above a boiling point (gaseous state) during analysis in the mass spectrometer because this is how mass spectrometer provides analysis.

#### ***Allowable Subject Matter***

Claim 9 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
